

I therefore propose to call the Western Australian shell
Chrysostoma obtusa (Dillwyn, 1817).

Trochus obtusus Dillwyn, 1817, Descriptive Cat., II, 1817, p. 809 (not of authors).

Trochus obtusus Chemnitz, 1795, (non-binomial) Conch. Cab. XI, p. 167, tab. 196
of 1884-5.

Trochus obtusus Philippi, 1846. Syst. Conch. Cab. (Martini & Chemnitz), Bd. II,
Abth. 3, p. 19, Taf. 4, fig. 3, 4.

The collectors give the following information on habitat
“Living on and around a small stone in six feet of water,
surrounded by *Posidonia*. Twenty-five yards south Jervois
Groin, Naval Base, Cockburn Sound, W. Australia.”

NEW NAME FOR *MUREX ESPINOSUS* MACP.

J. Hope Macpherson, M.Sc. Curator of Molluscs National
Museum of Victoria.

Murex espinosus Macp. was described in Memoirs, National
Museum, Melbourne No. 24, December, 1959, p. 55 but the name
is preoccupied by Hutton, 1886 (Trans. N. Zeal. Instit., vol. 18,
p. 333) who used it for a Pleistocene fossil. Therefore I propose
to replace it by *Murex tweediana*.
